

Figure 1: Schematic representation of the experimental design. The figure shows two identical experimental designs side-by-side. Each design starts with a 'Cobaltlight (C) 5050 BA Jackson W. Hn' light source. This is followed by a '2A' light source, which is then split into two paths: one through a '2A' light source and another through a '2A' light source. The paths then converge and pass through a '2A' light source. The final output is a '2A' light source. The diagram uses various symbols and labels to represent the light sources and their interactions.
